

DATA SHEET

**DDR3L SDRAM**

**240Pin Registered DIMM**

**Based on Elpida 2Gb D-die**

78-ball FBGA With Lead-Free  
(RoHS compliant)

**Revision History**

Revision No.	History	Draft Date	Remark
1.0	Initial Release	December, 2013	

## Features

- Package: 240-pin dual-in-line DDR3L memory module (RDIMM)
- Density: 4GB
- Organization: 512Mb\*72, 2 Rank
- Power supply: VDD = 1.35 V (1.283~1.45V)  
Backward compatible to VDD = 1.5 V  $\pm$ 0.075V
- Data rates: 1333Mbps(max.)  
Backward compatible to 1066Mbps
- 8 independent internal banks
- Bi-directional Differential data strobe (DQS, DQS#)
- Differential clock inputs (CK,CK#)
- Commands entered on each rising CK edge
- Eight-bit pre-fetch architecture
- DQS edge-aligned with data for READs
- DQS center-aligned with data for WRITEs
- DLL to align DQ and DQS transitions with CK
- Data mask (DM) for masking write data
- Burst lengths(BL): 8 and 4 with Burst Chop(BC)
- ZQ calibration for DQ drive and ODT
- On-die termination (ODT)
- Serial Presence Detect (SPD) with EEPROM
- Operating case temperature range:  
Tc = 0°C ~ 95°C
- Average refresh period:  
7.8us at 0 ~ 85°C; 3.9us at 85 ~ 95°C
- Asynchronous reset
- Lead-free (RoHS compliant) and Halogen-free
- For contact pads, electrolytic gold plating

## Ordering Information

Part Number	Density	Organization	Component Composition	Number of Rank	Gold plating thickness(min.)
RMS6101ED58F9W-1333	4GB	512M*72	256Mx8(EDJ2108EDBG-DJ-F) *18	2	0.76um

### Detailed Information

For detailed electrical specifications and further information, please refer to the component DDR3L SDRAM datasheet EDJ2108EDBG-DJ-F.

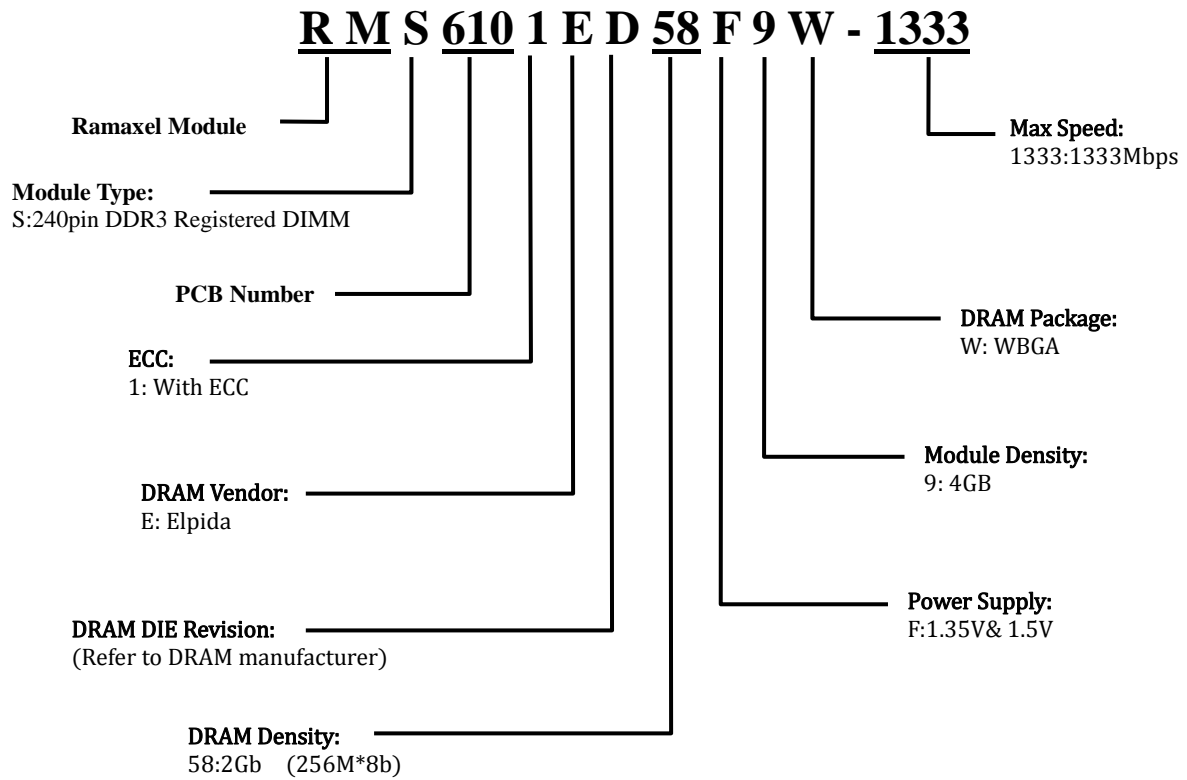

## Key Parameters

Speed	DDR3L-1066	DDR3L-1333	Unit
	7-7-7	9-9-9	
tCK(min)	1.875	1.5	ns
CAS Latency	5,6,7,8	5,6,7,8,9,10	tCK
tRCD(min)	13.125	13.5	ns
tRP(min)	13.125	13.5	ns
tRAS(min)	37.5	36	ns
tRC(min)	50.625	49.5	ns

## Address Configuration

Organization	Row Address	Column Address	Bank Address	Auto Precharge
256*8(2Gb) based module	A0-A14	A0-A9	BA0-BA2	A10/AP

## Part Number

## Pin Assignments

### Notes

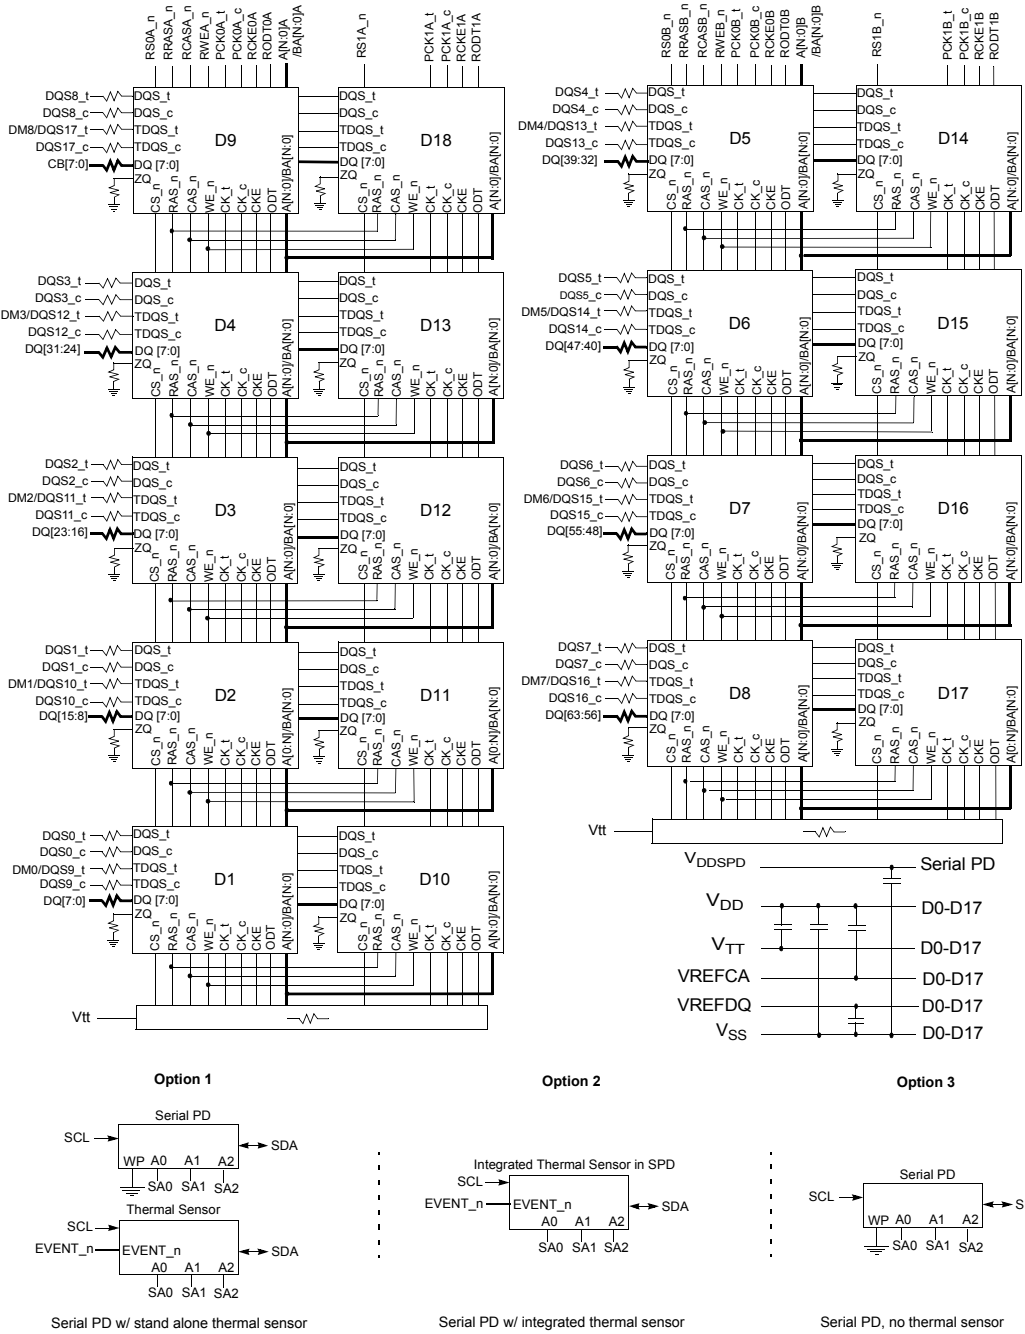

1. NC = No Connect, NU = Not Useable.
2.  $\overline{\text{S}}1$ , ODT1,CKE1: Used for dual-rank DIMMs; NC on single-rank DIMMs
3. CK1,NC and  $\overline{\text{CK}}1$ ,NC : Used for dual-rank UDIMMs, not used on single-rank DIMMs, but terminated
4. TEST used by memory bus analysis tools (unused on memory DIMMs)
5. DM[0:8] used on UDIMMs,DM8 is not used on x64 UDIMMs;NC,TDQS[9:17] and  $\overline{\text{TDQS}}[9:17]$  used on RDIMMs.

## Pin Functional Description

Symbol	Type	Polarity	Function
CK0/ $\overline{\text{CK0}}$ CK1/ $\overline{\text{CK1}}$	Input	Cross point	CK and $\overline{\text{CK}}$ are differential clock inputs. All the DDR3 SDRAM add/ctrl inputs are sampled on the crossing of positive edge of CK and negative edge of $\overline{\text{CK}}$ . Output (read) data is referenced to the crossing of CK and $\overline{\text{CK}}$ (Both directions of crossing).
CKE[0:1]	Input	Active High	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
$\overline{\text{S}}$ [0:1]	Input	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks.
$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{WE}}$	Input	Active Low	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , and $\overline{\text{WE}}$ (along with $\overline{\text{S}}$ ) define the command being entered.
ODT[0:1]	Input	Active High	When high, termination resistance is enabled for all DQ, DQS_t, DQS_c and DM pins, assuming this function is enabled on the DRAM.
DM[0:8]	Input	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
TDQS[9:17], $\overline{\text{TDQS}}$ [9:17]	Output		TDQS is enabled/disabled via the LOAD MODE command to the extended mode register (EMR). When TDQS is enabled, DM is disabled and TDQS and TDQS# provide termination resistance; otherwise, TDQS# are no function.
DQS[0:8] $\overline{\text{DQS}}$ [0:8]	I/O	Cross point	Data strobe for input and output data. For raw cards using x16 organized DRAMs, Pins DQ0–DQ7 are associated with the LDQS and $\overline{\text{LDQS}}$ pins and Pins DQ8–DQ15 are associated with UDQS and $\overline{\text{UDQS}}$ pins.
BA[0:2]	Input	-	Selects which SDRAM bank of eight is activated.
A0- A15	Input	-	During a Bank Activate command cycle, Address input defines the row address (RA0–RA15). During a Read or Write command cycle, Address input defines the column address. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0, BA1, BA2 defines the bank to be precharged. If AP is low, auto-precharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0, BA1, BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0, BA1 or BA2. If AP is low, BA0, BA1 and BA2 are used to define which bank to precharge. A12( $\overline{\text{BC}}$ ) is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed (HIGH, no burst chop; LOW, burst chopped).
DQ[0:63] CB0-CB7	I/O	-	Data and Check Bit Input/Output pins.
VDD, VSS	Supply	-	Power and ground for the DDR3 SDRAM input buffers, and core logic. VDD and VDDQ pins are tied to VDD/VDDQ planes on these modules.
VDDQ	Supply	-	Power supply for the DDR3 SDRAM output buffers to provide improved noise immunity. For all current DDR3 unbuffered DIMM designs, VDDQ shares the same power plane as VDD pins.
VDDSPD	Supply	-	Power supply for SPD EEPROM. This supply is separate from the VDD/VDDQ power plane. EEPROM supply is operable from 3.0V to 3.6V
VREFDQ	Supply	-	Reference voltage for I/O inputs.
VREFCA	Supply	-	Reference voltage for command/address inputs.
SDA	I/O	-	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. An external resistor may be connected from the SDA bus line to VDDSPD to act as a pullup on the system board
SCL	Input	-	This signal is used to clock data into and out of the SPD EEPROM. An external resistor may be connected from the SCL bus line to VDDSPD to act as a pullup on the system board.
SA[0:2]	Input	-	These signals are tied at the system planar to either VSS or VDDSPD to configure the serial SPD EEPROM address range.
$\overline{\text{EVENT}}$	Output	Active Low	This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the $\overline{\text{EVENT}}$ pin on the TS/SPD part
$\overline{\text{RESET}}$	Input	Active Low	The $\overline{\text{RESET}}$ pin is connected to the $\overline{\text{RESET}}$ pin on each DRAM. When low, all DRAMs are set to a known state.

## Block Diagram

Raw Card B1 (x72 DIMM, populated as two physical ranks of x8 DDR3 SDRAMs)

- NOTE 1 DQ-to-I/O wiring may be changed within a byte
- NOTE 2 Unless otherwise noted, resistor values are  $15\Omega \pm 5\%$ .
- NOTE 3 ZQ resistors are  $240\Omega \pm 1\%$ . For all other resistor values refer to the appropriate wiring diagram.
- NOTE 4 See the wiring diagrams for all resistors associated with the command, address and control bus.

## Electrical Specifications

All voltages are referenced to VSS (GND).

### Absolute Maximum DC Rating

Symbol	Parameter	Rating	Units	Notes
VDD	Voltage on VDD pin relative to VSS	-0.4 ~ 1.975	V	1
VDDQ	Voltage on VDDQ pin relative to VSS	-0.4 ~ 1.975	V	1
VIN, VOUT	Voltage on any pin relative to VSS	-0.4 ~ 1.975	V	1
TSTG	Storage Temperature	-55 ~ +100	°C	1,2

Notes:

- Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
- VDD and VDDQ must be within 300mV of each other at all times; and VREF must not be greater than 0.6 x VDDQ. When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV.

### Module Temperature Condition

#### Operating Temperature Condition

Parameter	Symbol	Rating	Unit	Notes
Operating case temperature	Tc	0 to +95	°C	1,2,3

Notes:

- Operating temperature is the case surface temperature on the center/top side of the DRAM.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 to 85°C under all operating conditions.
- Some applications require operation of the DRAM in the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
  - Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9µs. (This double refresh requirement may not apply for some devices.)
  - If Self-refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 bit [A6, A7] = [0, 1]) or enable the optional Auto Self-Refresh mode (MR2 bit [A6, A7] = [1, 0]).

## DC/AC Operating Condition

### Recommended DC Operating Conditions - DDR3L (1.35V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.283	1.35	1.45	V	1,2,3,4
VDDQ	Supply Voltage for Output	1.283	1.35	1.45	V	1,2,3,4
VrefCA(DC)	Input reference voltage for address, command inputs	0.49*VDD	-	0.51*VDD	V	5, 6
VrefDQ(DC)	Input reference voltage for DQ, DM inputs	0.49*VDD	-	0.51*VDD	V	5, 6

**Notes:**

1. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of VDD/VDDQ(t) over a very long period of time (e.g., 1 sec).
2. If maximum limit is exceeded, input levels shall be governed by DDR3 specifications.
3. Under these supply voltages, the device operates to this DDR3L specification.
4. Once initialized for DDR3L operation, DDR3 operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3 operation.
5. The AC peak noise on Vref may not allow Vref to deviate from Vref(DC) by more than  $\pm 1\%$  VDD (for reference: approx  $\pm 13.5$  mV).
6. For reference: approx.  $VDD/2 \pm 13.5$  mV.

### Recommended DC Operating Conditions - DDR3 (1.5V) operation

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
VDD	Supply Voltage	1.425	1.5	1.575	V	1,2,3
VDDQ	Supply Voltage for Output	1.425	1.5	1.575	V	1,2,3
VrefCA(DC)	Input reference voltage for address, command inputs	0.49*VDD	-	0.51*VDD	V	4,5,
VrefDQ(DC)	Input reference voltage for DQ, DM inputs	0.49*VDD	-	0.51*VDD	V	4,5,

**Notes:**

1. If minimum limit is exceeded, input levels shall be governed by DDR3L specifications.
2. Under 1.5V operation, this DDR3L device operates to the DDR3 specifications under the same speed timings as defined for this device.
3. Once initialized for DDR3 operation, DDR3L operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3L operation.
4. The AC peak noise on Vref may not allow Vref to deviate from Vref(DC) by more than  $\pm 1\%$  VDD (for reference: approx  $\pm 15$  mV).
5. For reference: approx.  $VDD/2 \pm 15$  mV.

## IDD Specifications and Conditions

DC Characteristics 1 (TC = 0 °C to +85 °C, VDD = 1.283 to 1.45V, VSS = 0V)

Data rate (Mbps)		1333	1066		
Parameter	Symbol	max.	max.	Unit	Notes
Operating current (ACT-PRE) (Another rank in IDD2P1)	IDD0	612	567	mA	
Operating current (ACT-PRE) (Another rank in IDD3N)	IDD0	810	738	mA	
Operating current (ACT-READ-PRE) (Another rank in IDD2P1)	IDD1	1440	1305	mA	
Operating current (ACT-READ-PRE) (Another rank in IDD3N)	IDD1	900	828	mA	
Precharge power-down standby	IDD2P0	216	216	mA	Slow PD Exit
	IDD2P1	324	324	mA	Fast PD Exit
Precharge standby current	IDD2N	540	486	mA	
Precharge standby ODT current	IDD2NT	540	486	mA	
Precharge quiet standby current	IDD2Q	540	486	mA	
Active power-down current (Always fast exit)	IDD3P	486	486	mA	
Active standby current	IDD3N	720	666	mA	
Operating current (Burst read operating) (Another rank in IDD2P1)	IDD4R	1062	972	mA	
Operating current (Burst read operating) (Another rank in IDD3N)	IDD4R	1215	1098	mA	
Operating current (Burst write operating) (Another rank in IDD2P1)	IDD4W	1800	1773	mA	
Operating current (Burst write operating) (Another rank in IDD3N)	IDD4W	1800	1593	mA	
Burst refresh current (Another rank in IDD2P1)	IDD5B	351	351	mA	
Burst refresh current (Another rank in IDD3N)	IDD5B	360	1656	mA	
All bank interleave read current (Another rank in IDD2P1)	IDD7	1008	918	mA	
All bank interleave read current (Another rank in IDD3N)	IDD7	1107	1017	mA	
RESET low current	IDD8	216	216	mA	

Self-Refresh Current (TC = 0 °C to +85 °C, VDD = 1.283 to 1.45V)

Parameter	Symbol	max.	Unit	Notes
Self-refresh current normal temperature range	IDD6	216	mA	
Self-refresh current extended temperature range	IDD6ET	324	mA	
Auto self-refresh current (optional)	IDD6TC	-	mA	

## SPD Matrix

Byte No.	Function described	Function support	Hex

## Dimensions

Unit: mm[inch]

\*Note: Tolerances on all dimensions  $\pm 0.15$  unless otherwise specified.

## CAUTION FOR HANDLING MEMORY MODULES

When handling or inserting memory modules, be sure not to touch any components on the modules, such as the memory ICs, chip capacitors and chip resistors. It is necessary to avoid undue mechanical stress on these components to prevent damaging them. In particular, do not push module cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

When re-packing memory modules, be sure the modules are not touching each other. Modules in contact with other modules may cause excessive mechanical stress, which may damage the modules.

## NOTES FOR CMOS DEVICES

### 1) PRECAUTION AGAINST ESD FOR MOS DEVICES

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

### 2) HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

### 3) STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.
